STEPS TO CREATE THE API (until part 3)

1. Create an entity that represents my main object type
    a. Have the main attributes set
2. Create an repository (would be later transformed into a DB)
    a. Need to have METHODS to interface with the Controllers and the entities
    b. We have TWO methods to RETRIEVE information about the items on our repository. (IEnumerable)
    c. We are using a GUID for identification //WHAT IS A GUID?
3. Create CONTROLLERS (: ControllerBase)
    a. Here we gonna have the interaction between our requests and the rest of our application
    b. Here we use the [ApiController] and define our [Route]
